(Enclosure No. 4 to DepEd Order No. 23, s. 2014)

DEFINITION OF TERMS:

Armed conflict – conflicts that may result in a significant number of lives lost due to weapons and weapons of mass destruction, and may result in the displacement of a population. Armed conflict may include terrorism and insurgencies.¹

Disasters/Calamities – a result of the combination of: the exposure to a hazard; the conditions of vulnerability that are present; and insufficient capacity or measures to reduce or cope with the potential negative consequences. Disaster impacts may include loss of life, injury, disease and other negative effects on human physical, mental and social well-being, together with damage to property, destruction of assets, loss of services, social and economic disruption and environmental degradation.²

Disaster risk reduction – The concept and practice of reducing disaster risks through systematic efforts to analyze and manage the causal factors of disasters, including through reduced exposure to hazards, lessened vulnerability of people and property, wise management of land and the environment, and improved preparedness for adverse events.³

Drought – long lasting event; triggered by lack of precipitation. A drought is an extended period of time characterized by a deficiency in water supply that is the result of constantly below average precipitation. A drought can lead to losses to agriculture, affect inland navigation and hydropower plants, and cause a lack of drinking water and famine.

Earthquake – shaking and displacement of ground due to seismic waves. This is the earthquake itself without secondary effects. An earthquake is the result of a sudden release of stored energy in the Earth's crust that creates seismic waves. They can be of tectonic or volcanic origin. At the Earth's surface they are felt as a shaking or displacement of the ground. The energy released in the hypocenter can be measured in different frequency ranges. Therefore there are different scales for measuring the magnitude of a quake according to certain frequency ranges. Those are: a) surface wave magnitude (Ms); b) body wave magnitude (Mb); c) local magnitude (ML); moment magnitude.⁴

Fire – the interaction of heat, fuel, and oxygen which will result in a chemical reaction called burning. Uncontrollable fires may be caused by faulty electrical wiring.⁵

Forest fire – fires in forest that covers extensive damage. They may start by natural causes such as volcanic eruptions or lightning or they may be caused by arsonists or careless smokers, by those burning wood, or by clearing a forest area.⁶

Flood – significant rise of water level in a stream, lake, reservoir or coastal region.⁷

Hazard - A potentially damaging physical event, phenomenon or human activity that may cause the loss of life or injury, property damage, social and economic disruption or environmental degradation⁸

Landslide – any kind of moderate to rapid soil movement including lahar, mudslide, debris flow. A landslide is the movement of soil or rock controlled by gravity and the speed of the movement usually ranges between slow and rapid, but not very slow. It can be superficial or deep, but the materials have to make up a mass that is a portion of the slope or the slope itself. The movement has to be downward and outward with a free face.

Oil spill – the pollution of air or water due to the accidental release of oil and other chemicals. One is considered exposed to chemicals by inhaling, or by the chemical coming in contact with food, water, medicine or clothing thus making it hazardous to pupils/students

Storm surge- is a rise of seawater above normal sea level on the coast, generated by the action of weather elements such as cyclonic wind and atmospheric pressure. Sea level is raised and driven towards the coast. Where the depth is shallow and the slope of the sea bed is gradual, the natural flow of the water is delayed by the effect of friction on the sea bed. As more water moves from the sea to the coast excess water piles up on the shore line. This piling up of water makes a large volume of water which might eventually flow into the hinterland some distance from the coast.

Structural collapse – the loss of the structure integrity of a building, causing the ceilings, walls, roofs, etc. to fall and possibly result in personal injury or death.

Tsunami – waves advancing inland. A tsunami is a series of waves caused by a rapid displacement of a body of water (ocean, lake). The waves are characterized by a very long wavelength and their amplitude is much smaller offshore. The impact in coastal areas can be very destructive as the waves advance inland and can extend over thousands of kilometers. Triggers of a tsunami can be: earthquakes, volcanic eruptions, mass movements, meteorite impacts or underwater explosions.⁹

⁹ http://www.phivolcs.dost.gov.ph/index.php?option=com_content&view=article&id=77&Itemid=129

Volcanic eruption – all volcanic activity like rock fall, ash fall, lava streams, gases, etc. Volcanic activity describes both the transport of magma and/or gases to the Earth's surface, which can be accompanied by tremors and eruptions, and the interaction of magma and water (e.g. groundwater, crater lakes) underneath the Earth's surface which can result in phreatic eruptions. Depending on the composition of the magma, eruptions can be explosive and effusive and result in variations of rock fall, ash fall, lava streams, pyroclastic flows, emission of gases, etc.¹⁰

Vulnerability - the characteristics and circumstances of a community, system or asset that make it susceptible to the damaging effects of a hazard.¹¹
